

Random set: applications to free boundary problems.

Marc Dambrine

IPRA-LMAP, Université de Pau et des Pays de l'Adour

The notion of random set leads to various notions of expectations. We will present some of them (Vorobe'v and Aumann expectations) and focuss on a notion derived from the oriented distance function. We will explain how to deduce convergence of the sets from the convergence of the distance function, provide a central limit theorem for the distance function and for sets.
